DETAILED ACTION

1. This Office Action is the answer to the Amendment filed on January 7, 2002, which paper has been placed of record in the file.
2. Claims 1-19 are pending in this application.

Allowable Subject Matter/Reasons for Allowance

3. The closest priors arts, Walker (US 5,897,620) discloses a method and system for selling airline tickets that have an unspecified departure time (column 2, lines 24-29). Walker further discloses the user of a revenue management system (RMS) to analyze historic demand and pricing information for previous flights along a specified route during a specified time period. The RMS then uses this analysis to determine a number of unspecified-time airline tickets to create for a specific flight. Customers of the airline can then purchase the unspecified-time airline tickets through a special fare listing in an Airline Reservation System (column 4, lines 38-58). Hornick (US 5,270,921) discloses an airline seat reservation system in which seat reservation are controlled using a seat inventory control system (column 4, lines 19-21). The airline seat reservation system discloses in Hornick uses a flight network database to generate seat booking limits and marginal seta revenues to determine whether to accept or reject seat reservation request from customers (column 4, line 60-column 5, line 5). Whitesage discloses a system for determining "true" origin-to-destination travel data from segment travel information stored as

segment data in a travel reservation database. Using the segment information, the system determines true travel cost and time data with reference to standard units(e.g., cost per distance unit and travel distance per time unit). This true travel cost and time data can then be used to determine direct costs such as fare price and indirect costs such as travel costs per unit of employee time (column 4, line 54-column 5, line 4). Therefore, it is clear from the description of Walker's and Hornick and Whitesage's inventions that the prior arts do not considered the possibility of: calculating a component value for each component by performing the steps: assuming a beginning value for each component, calculating prorated values such on that component by calculating the difference between the product price and a value of the product's other components and calculate a component value as a function of the prorated values and the probability values, as included in claims 1 and 16; for each order point, calculating an incremental production quantity and calculating revenue displaced by the incremental production quantity using the set of product values and calculating an average displaced revenue, as included in claim 6; calculating an expected revenue from a plurality of products for at least two available capacities and calculating an asking price for each of the products as the difference between the expected revenue from the product for successive available capacities, as included in claim 11.

4. Claims 2-5, 7-10, 12-15, and 17-19 are allowed because they are dependent claims of the allowable independent claims 1, 6, 11, and 16.
